

Please allow market forces and not artificial barriers such as restrictive regulations to determine satellite radio's future. For example, I am looking forward to receiving traffic info via satellite radio in the Atlanta area (planned) and hope that you won't prevent this innovative technology from being used. When I need traffic info in Atlanta, I typically need it immediately to avoid congestion, wrecks, etc. Broadcast radio may offer this info every 10 minutes during peak times and infrequently afterwards and I may or may not be able to find the right station. Satellite info may reduce congestion for everyone, not just satellite users, by providing drivers with TIMELY info on alternate routes, etc. Every satellite user that takes a less congested route makes it easier on the non users that are in the congestion (probably listening to broadcast radio).
